LOW-CODE DEVELOPMENT

Reg No: 2116241501162

Name: Rakesh B

Class & Section : AIML 'C'

Choose the best answer for each question. The correct option and a brief explanation are provided after every question.

The Limits of Low-Code Platforms

1. What is the main purpose of a low-code platform?

A. To eliminate all software testing

B. To build applications with less hand-coding

C. To replace databases completely

D. To create hardware components

Answer: B. To build applications with less hand-coding
Low-code platforms provide visual tools and reusable components to reduce manual coding.

2. Which is a common limitation of low-code platforms?

A. They cannot create any user interfaces

B. They always require assembly language

C. Limited flexibility for highly specialized requirements

D. They cannot store data

Answer: C. Limited flexibility for highly specialized requirements
Complex or unusual requirements may exceed the platform's built-in capabilities.

3. What does vendor lock-in mean?

A. An application depends heavily on one vendor's platform

B. A developer is locked out of an account

C. Data is always stored offline

D. An app cannot be updated

Answer: A. An application depends heavily on one vendor's platform
Moving an application away from a vendor may require significant effort or redevelopment.

4. Which factor should be checked when evaluating a low-code platform for a large application?

A. Logo design only

B. Keyboard colour

C. Number of desktop wallpapers

D. Scalability and performance

Answer: D. Scalability and performance
The platform should handle expected users, data volume, and workload.

5. Which practice helps reduce security risks in low-code applications?

A. Sharing administrator credentials

B. Applying access controls and regular security reviews

C. Disabling authentication

D. Publishing all data publicly

Answer: B. Applying access controls and regular security reviews
Role-based access, secure configuration, and regular reviews help protect applications and data.

Glimpses of Pro Code in Zoho Creator and Catalyst

6. What is pro-code development?

A. Building software only with drag-and-drop blocks

B. Avoiding programming languages

C. Writing code to implement application functionality

D. Using spreadsheets without logic

Answer: C. Writing code to implement application functionality
Pro-code development relies on writing code for greater control and customization.

7. Which scripting language is commonly used for custom logic in Zoho Creator?

A. Deluge

B. COBOL only

C. CSS

D. SQL alone

Answer: A. Deluge
Deluge is Zoho's scripting language for workflow automation and application logic.

8. In Zoho Creator, what is a workflow commonly used for?

A. Changing the computer's operating system

B. Designing physical networks

C. Replacing every database

D. Triggering actions when specified events occur

Answer: D. Triggering actions when specified events occur
Workflows can run actions when form events, schedules, or other configured triggers occur.

9. What is Zoho Catalyst primarily designed to help developers do?

A. Edit videos only

B. Build and deploy applications using cloud development services

C. Manufacture computer chips

D. Replace internet connectivity

Answer: B. Build and deploy applications using cloud development services
Catalyst offers cloud services and developer tools for building and deploying applications.

10. When is custom code especially useful in a Creator or Catalyst project?

A. When no application logic is needed

B. When all data must be public

C. When requirements need specialized logic or integrations

D. When the project must avoid all testing

Answer: C. When requirements need specialized logic or integrations
Custom code can handle specialized business rules, APIs, and integrations beyond standard components.

The No-Code to Low-Code to Pro-Code Spectrum Revisited

11. Which statement best describes no-code development?

A. Applications are built mainly through visual tools with little or no hand-written code

B. Every feature must be written in C

C. It is only used for operating systems

D. It never supports automation

Answer: A. Applications are built mainly through visual tools with little or no hand-written code
No-code tools emphasize visual configuration for users with little programming experience.

12. Which approach generally offers visual development plus the option to add code?

A. Hardware coding

B. No-code only

C. Manual assembly

D. Low-code

Answer: D. Low-code
Low-code combines visual building blocks with coding for additional flexibility.

13. Which approach usually provides the greatest control over implementation?

A. No-code

B. Pro-code

C. Template-only configuration

D. Form filling

Answer: B. Pro-code
Pro-code allows developers to control architecture and implementation in detail.

14. Which is an important factor when choosing between no-code, low-code, and pro-code?

A. The developer's favourite colour

B. The number of icons on a screen

C. Project complexity and customization needs

D. The computer's wallpaper

Answer: C. Project complexity and customization needs
The best approach depends on complexity, integration needs, skills, time, and maintenance.

15. A team starts with a visual app builder but later needs a custom API integration. What is a sensible next step?

A. Evaluate scripting or pro-code extensions

B. Remove all data

C. Stop testing permanently

D. Disable the integration requirement without review

Answer: A. Evaluate scripting or pro-code extensions
Extending the solution with code may meet requirements while preserving useful visual components.

Career Pathways

16. Which role commonly builds applications using visual low-code tools?

A. Audio technician only

B. Network cable manufacturer

C. Graphic printer operator

D. Low-code application developer

Answer: D. Low-code application developer
Low-code application developers create and maintain applications using platform tools.

17. Which skill is useful for a Zoho Creator developer?

A. Avoiding data models

B. Deluge scripting and workflow design

C. Never testing forms

D. Disabling permissions

Answer: B. Deluge scripting and workflow design
Deluge, form design, data modeling, workflows, and integration skills are valuable.

18. Why is knowledge of APIs valuable in low-code development?

A. It removes the need for security

B. It prevents data storage

C. It allows applications to communicate with external services

D. It replaces user requirements

Answer: C. It allows applications to communicate with external services
APIs enable data exchange and integration between applications and services.

19. Which activity is part of a low-code developer's responsibilities?

A. Gathering requirements, configuring, testing, and maintaining applications

B. Only choosing a logo

C. Avoiding users

D. Disabling backups

Answer: A. Gathering requirements, configuring, testing, and maintaining applications
The role often spans requirements, design, development, testing, deployment, and maintenance.

20. What is a sensible first step for someone beginning a career in low-code development?

A. Start with the most complex enterprise system immediately

B. Ignore documentation

C. Avoid building projects

D. Learn platform basics and build a small project

Answer: D. Learn platform basics and build a small project
A small project builds practical experience with forms, data, workflows, and testing.

The Future of Low-Code

21. How can artificial intelligence improve low-code platforms?

A. By removing all need for human review

B. By assisting with app generation, automation, and code suggestions

C. By making every application insecure

D. By eliminating all business rules

Answer: B. By assisting with app generation, automation, and code suggestions
AI can help generate components, suggest logic, classify information, and automate repetitive tasks.

22. Which statement best describes the likely relationship between low-code and professional developers?

A. Low-code guarantees all developers will disappear

B. Pro-code will never be used again

C. Low-code may automate routine work while developers handle complex requirements and oversight

D. Developers will no longer need to test software

Answer: C. Low-code may automate routine work while developers handle complex requirements and oversight
Low-code can complement developers, while complex architecture, integrations, and governance still need expertise.

23. How can low-code support digital transformation?

A. By helping organizations build and update business applications faster

B. By preventing process automation

C. By requiring every task to remain manual

D. By banning data integration

Answer: A. By helping organizations build and update business applications faster
Low-code can accelerate application delivery and digitize workflows.

24. As low-code adoption grows, which issue becomes especially important?

A. Choosing screen wallpaper

B. Removing all access permissions

C. Avoiding documentation

D. Governance, security, and application maintenance

Answer: D. Governance, security, and application maintenance
Organizations need standards for security, access, quality, ownership, and ongoing support.

25. Which trend is likely to shape the future of low-code development?

A. Complete rejection of cloud services

B. Greater integration of AI and automation

C. Elimination of APIs

D. Ending application integration

Answer: B. Greater integration of AI and automation

AI-assisted development and workflow automation are important emerging directions.
